About this document

The information found in this document provides the current Talk2M server addresses for the various VPN servers around the world. While this information may be subject to change, it should reflect the most recent VPN server addresses.

IMPORTANT

Under some circumstances, it is necessary to shift a Talk2M account from one VPN server to another. In addition, as our service grows, new VPN servers are added. If modifications are required to your network to allow outbound connections to one of the IP addresses listed below on either port 443 or port 1194, we recommend allowing outbound connections at this port to all addresses to prevent connection problems if your account is moved or if new VPN servers are added.

Important:

Since firmware 6.4s6, when eWON connects through a Proxy server, it will use the hostname (and not the IP address) to connect to the VPN server. So the Proxy on local site should allow outbound connections on Port TCP 443 to hostname: *.talk2m.com.

No need to encode all Talk2M VPN server IP addresses on the Proxy server.
